TARGET INSTRUMENT: R_75 Volatility Model

CORE PERFORMANCE METRICS

Total Settlements:	400	Calculated Profit Factor:	27.47
Win Accuracy:	91.8% (367W / 33L)	Max Peak Drawdown:	0.1%
Cumulative PnL:	\$333.76	Avg. PnL per Trade:	\$0.83

EQUITY CURVE PROGRESSION

PERFORMANCE MILESTONES (100-TRADE SEGMENTS)

SEGMENT	WIN RATE	NET PnL	REFINEMENT EFFICIENCY
Trades 1-80	87.5%	\$10.50	+105% [OK]
Trades 81-160	81.3%	\$25.29	+98% [OK]
Trades 161-240	100.0%	\$92.60	+120% [OK]
Trades 241-320	100.0%	\$112.00	+120% [OK]
Trades 321-400	90.0%	\$93.37	+108% [OK]

% - High Win-Rate (91.8%)%

execution should be programmatically bypassed:

$$\text{Edge Filter: } (\text{ATR}_{14} \times \text{atrStopMultiplier}) > 4 \times (\text{Commissions} + \text{Slippage Estimator})$$

3. **Asymmetric Stop Trailing:**

Transition from a static `atrStopMultiplier` to an adaptive trail. Once a trade achieves 1.0σ excursion in favor of the trade, trailing stop must immediately compress to Break-Even + 1 tick to protect the micro-PnL edge.
